

schaerer[®] Modular Traction System (MTS): **One surgical table – Multiple disciplines!**

The latest MTS-system based on a new developed seat plate allows converting the operating table for different surgical disciplines much faster and easier. In addition all necessary accessories fit into a small footprint trolley. These points help to save time and reduce failures.

Thanks to its modularity, the seat plate ADVANCED offers an interface for standard accessories as well as orthopedic traction.

General surgery

With connected supplement bars, the operating table can be used for any kind of surgical disciplines such as general surgery, urology, gynecology, ENT, ophthalmology or even neuro surgery.

Orthopaedic surgery

With a few steps the table top can be converted into a traction table including a variety of different bars and leg holders.

Shoulder surgery

Due to its modularity the (motorized) seat plate can also be used for shoulder surgery. A dedicated head support allows individual adjustment of the head before, during and after surgery.
